

Chapter 17

## SAMPLING DISTRIBUTION MODELS

1

---

---

---

---

---

---

---

---

### SAMPLING DISTRIBUTION

- ✘ This is the distribution of probabilities we would obtain from every possible combination of samples
- + This distribution is theoretical whereas the distributions we looked at before were distributions of *data*

2

---

---

---

---

---

---

---

---

### EXAMPLE DISTRIBUTION FOR A COIN

Number of Heads	Frequency
0	1
1	6
2	15
3	20
4	15
5	6
6	1

---

---

## PROPORTIONS

- ✘ The actual proportion for the population is  $p$
- ✘ Our observed proportion for our sample is  $\hat{p}$
- ✘ We define  $q = 1 - p$  and  $\hat{q} = 1 - \hat{p}$
- ✘ The sampling distribution follows a normal model with mean  $p$  and standard deviation  $\sqrt{\frac{pq}{n}}$
- ✘ That is, the model that describes the distribution of sample proportions is

$$N\left(p, \sqrt{\frac{pq}{n}}\right)$$

---

---

---

---

---

---

---

---

## SAMPLING DISTRIBUTION FOR A PROPORTION

From Stats *Modeling the World* by Bock, Velleman, & De Veaux, 2010, p. 414.

---

---

---

---

---

---

---

---

## ASSUMPTIONS AND CONDITIONS

- ✘ There are two assumptions in the case of the model for the distribution of sample proportions:
  1. The sampled values must be independent of each other.
  2. The sample size,  $n$ , must be large enough.
- ✘ Conditions we can check (p. 449)
  - + Randomization, 10% condition, Success/Failure

---

---

---

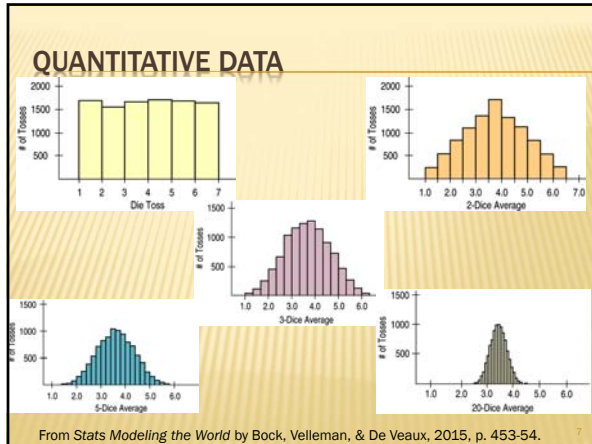

---

---

---

---

---

---

---

---

---

---

---

---

---

### CENTRAL LIMIT THEOREM

- ✘ If  $n$  is sufficiently large, the sample means of random samples from a population with mean  $\mu$  and finite standard deviation  $\sigma$  are approximately normally distributed and modeled by

$$N\left(\mu, \frac{\sigma}{\sqrt{n}}\right)$$

8

---

---

---

---

---

---

---

---

### ASSUMPTIONS AND CONDITIONS

- ✘ Independence of observations
- ✘ Sufficiently large sample size
- ✘ We can check:
  - + Randomization
  - + 10% condition
  - + Large enough sample size

9

---

---

---

---

---

---

---

---

**CAUTION**

- ✘ Read “What can go wrong?” on p. 462
  - + Don't confuse the sampling distribution with the distribution of the sample
  - + Beware of observations that are not independent
  - + Watch out for small samples from skewed populations
